

Enterprise-wide Greenhouse Gas Inventory and Reporting System

Client

The Williams Companies, Inc.

Location

Throughout the USA

Budget

Undisclosed

Project Completed

2007

The Need

The Williams Company, Inc., including four Williams Energy business units of exploration and production, midstream, pipeline and power, had two consecutive needs. The first need was a baseline greenhouse gas (GHG) inventory for the enterprise. The second need was establishing an inventory reporting system for multiple business units in order to integrate efforts, updating individual business group GHG inventory management plans, and identifying and implementing information management solutions.

CH2M HILL Solutions

CH2M HILL worked with each of Williams' business units to develop detailed GHG inventory management plans, operator training, senior management training, data collection, data management tools analysis, and development and support of consistent inventory development across the organization.

We also deployed technical resources to address the different levels of support and skills required by each of the business units. Cross-unit coordination assured projects were completed to satisfy overall corporate goals.

The Result

The Williams Company now has a robust and transparent GHG management system where they can identify, track, and reduce GHG emissions to meet their business and regulatory needs.

"CH2M HILL provides real value to Williams through their leadership and knowledge in our industry and GHG management. The Williams and CH2M HILL team has worked successfully to achieve our goals in building a high quality and verifiable inventory management program."

—Dennis Elliott, Director,
Corporate Loss Control, The Williams Company
