Northern Alberta

Major Oil Sands Project

Our Confidential client is one of the major Canadian Oil Sands producers focused on developing Canada's natural resources in northern Alberta. The first phase of the multi billion dollar project is expected to produce in excess of 100,000 b/d of synthetic oil from a conventional oil sands mine.

CH2M HILL Construction Canada was a general contractor responsible for the installation of piping modules and interconnecting pipe as well as the replacement and repair of defective pipe within existing modules installed by a previous contractor.

There were in excess of a 100 modules as well as interconnecting pipe ranging in diameter from ½ inch to 50 inches.

The greatest challenge on this project was the remote northern location as well as the highly congested work site within an existing pipe rack.
